Authentic assessment: What does it mean and how is it instantiated by a group of distance learning academics?

Denise Whitelock and Simon Cross, The Open University

Abstract
This paper reports on a project undertaken at The Open University which set out to explore academics’ notion and practice of authentic assessment. The findings revealed that authentic assessment is not only a difficult notion to define but it is also problematic to collate features within an assessment task that define it as authentic assessment. An electronic questionnaire was constructed to investigate academics’ understanding of authentic assessment. The tutors’ perceptions of authentic assessment fell into two distinct areas: one that is associated with real world scenarios and the other linked to the construction and marking of an authentic assessment task. The findings point the way towards increasing the understanding of this concept in order to avoid making assessment appear on the surface to be more like real life but with the students still perceiving the questions to be rather artificial and contrived.

Keywords
Authentic assessment; electronic questionnaire; authenticity; assessment tasks; design frameworks.

Introduction
There has been a growing interest over recent years in how higher education can provide students with meaningful experiences and better prepare them with the knowledge and skills for their future careers and lives. This often aligns with an interest in making learning a more authentic experience and, of course, any innovation seeking to build more authenticity into the learning experience should also seek a corresponding drive to greater authenticity in how, when and why students are summatively and formatively assessed.

Understanding what is meant by authentic assessment is a task in itself. The literature reveals that the academic community believes that designing and implementing authentic type assessments is a laudable goal and contextualising assessment, within a set of authentic and real life tasks, is one to be taken seriously (Dochy 2001; Gielen 2003). However there is little agreement around the definition of authentic assessment, which in itself presents a challenge when seeking to innovate and change current assessment practices within a higher education institution.

This paper reports on a project undertaken at The Open University which set out to explore academics’ notion and practice of authentic assessment through the exploration of the following research objectives:

1. To understand what is meant by authentic assessment in the literature by examining a set of examples of authentic assessments.

2. To construct a questionnaire which could be used by Open University academics to explore their understanding of authentic assessment.
3. To investigate, through means of a questionnaire, the types of assessment
academics were currently undertaking and whether they fitted into, through
means of a questionnaire, a broad definition of authentic assessment.

**The research community’s understanding of authentic assessment**

Over the last twenty years, authenticity in learning and teaching has evolved into a
complex, multi-layered discourse with a supporting research base and practical
application. The idea that learning needs to be more ‘authentic’ has several origins
but became more established by the mid-1980s. However, it was the use of
‘authentic assessment’ by social constructivism that has had the most widespread
impact. It was used within this context to reframe the role of assessment and to
problematised traditional assessment which formed part of what Serafini (2001)
considers the most recent of the assessment paradigms, known as ‘assessment for
enquiry’.

Wiggins (1993) used the authentic notion of assessment to question the usefulness
of current testing regimes in the US by defining authentic as ‘[the extent to which] a
student experiences questions and tasks under constraints as they typically and
“naturally” occur, with access to the tools that are usually available for solving such
problems’. Torrance (1995) too makes a useful attempt to summarise this idea by
declaring: ‘[it is that] assessment tasks designed for students should be more
practical, realistic and challenging than what one might call “traditional” and went on
to suggest it is used as ‘a generic term…to describe a range of new approaches to
assessment’.

The notion of authenticity in assessment tasks has gained momentum and has been
integrated into models or principals of instruction as illustrated by the first of Merrill’s
five principles of instruction (2002). Falchikov (2005) also observes that ‘authentic
assessment appears to be increasingly used in further and higher education’.
However, she also notes that the term is less widely used or understood than the
actual activities that can be identified as authentic. Falchikov gives an example from
her experience:

‘My own work…has involved my students in all of the activities [I regard as
authentic]. However, I have not used the term “authentic” to describe the type of
assessment being carried out. Of course this does not mean that the activities were
not authentic. Dierick and Dochy (2001) have argued that students rate assignments
such as projects, group exercises, portfolios and peer assessment as meaningful
because they are authentic. Thus the use of authentic assessment may be far more
widespread than appears at first glance’ (72).

Furthermore, as the notion has matured a number of questions have arisen about it:
some in relation to clarifying how it differs from other related ideas such as
alternative assessment, competence-based assessment, performance assessment
and sustainable assessment; yet others have been more searching. Inbar-Lourie
and Donitsa-Schmidt (2009) described authentic assessment as a ‘controversial
concept’ which, whilst a view not shared by all critics, certainly reveals the range of
perspectives held within the research community.

Whitelock (2011) investigated whether Web 2.0 tools could support authentic
assessment. She found much of what has been deemed authentic assessment pre-
dates Web 2.0 tools where the advantage of using authentic assessment has been
that candidates’ real life performance skills can be demonstrated in the course of the
examination rather than an elicitation of inert knowledge. Whitelock does however report a recent research project conducted by Williams and Wong (2009) which has drawn on the resources of Web 2.0 tools to investigate the effectiveness of ‘open-book, open-web’ (OBOW) at university level. The driver to adopt open book final exams was to adopt a constructivist pedagogy for final exams. Their research took place at U21 Global which is a solely online university with 4,000 students in 60 centres and has been running since 2003. Williams and Wong surveyed all students who had taken traditional summative examinations and open book final examinations. The researchers wanted to test concerns about plagiarism issues and that technology enhances these difficulties (McMurtry 2001) and that students can share information and exam questions via email (Kleiner and Lord 1999) and are open to more dishonest practices. In this study the opportunity for cheating in OBOW was ranked lowest by the students (n=54) than any other dimension. The advantages were reported increased flexibility and a format ‘relevant to business/professional education’. Also the intellectual challenge and engaging content of the questions were rated highly by the students.

The literature reveals that authentic assessment is not only a difficult notion to define but it is also problematic to collate features within an assessment task that define it as an authentic assessment. We have drawn on the work of Savery and Duffy (1995) McDowell (1995) Hart (1994) Herrington and Herrington (1998) Cronin (1993) and Struyven et al. (2003) to counter a number of features that were common to a range of ‘authentic’ assessment tasks. These included:

• collaboration that is similar to that experienced by practitioners or experts in the field;
• simulations of role-play or scenarios;
• problem tasks that are like those encountered by practitioners or experts in the field;
• resources (documents, data, etc.) taken specifically from real-world case studies or research;
• tasks that students find meaningful;
• examinations taking place in real-world settings;
• a range of assessment tasks rather than just the ‘traditional’ ones;
• demonstration and use of judgment;
• students being involved in the negotiation of the assessment task;
• a test of how well the student thinks like a practitioner/expert in the field (i.e. ‘in-tune’ with the ‘disciplinary mind’).

These features were then turned into a set of statements in the questionnaire administered to OU academics.

Method
An electronic questionnaire (which was powered by SurveyMonkey) was constructed to investigate academics’ understanding of authentic assessment in such a way that a definition was not revealed to the participants per se but instead elicited through an examination of their practice. The questionnaire consisted of three major sections. The first asked participants to rate how important the factors identified from the authentic assessment literature were to assessing students in their own particular discipline. The participants had to rate each factor on a 4-point Likert scale as either very important, quite important, slightly important or not at all important.
The second part of the electronic questionnaire asked participants to reflect upon one module they were currently chairing and to respond to a number of questions about the type of assessment they were using in that module. The questions were designed to show, for example, how successful the assessments were in getting students to:

- collaborate in similar all life experiences;
- answer problems which are like those encountered by practitioners or experts in the field.

In other words, these questions mirrored those in the first section but now we were probing whether the desirable features of authentic assessment tasks were taking place in their own teaching – without giving away what we meant by authentic assessment or designing it as such so far in the questionnaire.

Only in the third and final section of the electronic questionnaire were the academics asked if they had encountered the term ‘authentic assessment’ before, together with a set of other terms which included:

- alternative assessment;
- authentic assessment;
- learning design;
- authentic learning;
- feed-forward.

They were finally asked in the third section of the questionnaire: ‘How important is it to you and your students that assessment activities and questions try to be as authentic as possible?’ They were again asked to respond using a 4-point Likert scale ranging from very important to not important.

The Associate Deans with responsibility for teaching and learning were contacted from all the faculties. They were asked to circulate the invitation to participate in this survey about assessment practices (authentic assessment was not explicitly mentioned) to their module chairs.

In MCT and Science the Associate Dean circulated the invitation to respond to all module chairs. In the other Central Academic Units a sample of twenty staff were personally invited to take part. The response rate for the latter group was 30-50%. The final number of participants was 102 and the breakdown into faculty respondents is shown in table 1.

There are a greater number of responses from the Maths, Computing & Technology Faculty and Science and so when reviewing the results from the electronic survey the ‘totals’ are weighted in their favour.

**Results**

The findings from the first part of the questionnaire revealed that the most important factors where over 80% of respondents rated them as important were that assessment tasks should be:

- meaningful;
- aligned to learning outcomes or objectives (which implicitly would be termed as authentic);
- resources taken specially from real world case studies or research.

Seven of the other factors as shown in Table 2 below were less important, such as:
- a range of assessment tasks rather than traditional ones;
- demonstration and use of judgments.

Those that were considered to veer towards slightly important or not at all important included:
- examinations taking place in real-world settings;
- collaboration that is similar to that experienced by practitioners or experts in the field and coursework or reflective logs.

The second part of the questionnaire probed how successful the academics were with the following factors. There were only two factors where they declared they were *fully successful* and these were:
- use of resources taken specifically from real-world case studies or research (41% said fully successful);
- use of a range of assessment tasks rather than just traditional ones (29% said fully successful).

The factors where the academics felt their achievements were *mostly successful* were:
- students consider assessment activities meaningful (49%);
- answer problems that are like those encountered by practitioners or experts in the field (39%);
- use methods and procedures similar to those used by real practitioners or experts in the field (28%).

Meanwhile the areas where there was *less success* included:
- demonstrate how well they think like a practitioner;
- adopt a sustainable life-long approach to learning;
- experience collaboration similar to the real experience of relevant practitioners or experts.

</table>

An exploratory factor analysis was carried out on the responses in table 2. First principle components analysis was used to determine the number of factors to extract. This analysis identified two components with eigenvalues greater than 1 which explained 62% of the total variance. The idea that two factors should be
extracted was supported by Cattell’s (1966) scree test. Finally the extracted factor matrix was submitted to an Oblimin with Kaiser rotation method (see table 3).

Table 3: Factor correlation matrix

| Factor 1 | 1.000 | -0.389 |
| Factor 2 | -0.389 | 1.000 |

Factor 1 is loaded with respect to an assessment which is meaningful, sustainable and involves collaboration that is similar to that experienced by practitioners or experts in the field. Authentic here tends to mean the use of real-world scenarios as an induction into authentic practice. The other factor describes the mechanics of authentic assessment i.e. how it should be graded and the complexity of an authentic assessment.

These results have implicitly probed the academics’ notions of authentic assessment and finally we asked them to make explicit if they had heard of the term ‘authentic assessment’. In fact only 24% were familiar with this term as shown in table 4.

Discussion

One of the features of authentic assessment described in the literature is that the assessment tasks are meaningful to the students. Only 26% of the academics surveyed believed they had ‘fully succeeded’ in producing a course where the students considered the assessment tasks meaningful. A further 49% felt they had ‘mostly succeeded’, yet in the first part of the survey 75% of the participants declared that meaningful tasks were very important for assessment in their subject area. This is not such a surprising finding as designing probing, insightful and meaningful assessments is a difficult undertaking but one can see from the responses that the academics in question are working towards this goal.

About a third of courses were using fieldwork or work-based learning in their assessment portfolios. However, ‘simulations of role-play’ and ‘examinations taking place in real-world settings’ were regarded as of little importance in these subject areas. This is a surprising finding as one would expect that those subject domains which make use of fieldwork or work-based assessment in their courses would also consider the examinations taking place in real-world settings as important. This finding deserves further investigation and will be followed up in a set of semi-structured interviews.
Another interesting finding was that although 43% of courses are using electronic tutor forums for assessment, the course chairs declared that they had only partially succeeded in designing a course that gives students ‘experience of collaborations that are similar to the real experiences of relevant practitioners or experts’. In fact a ‘real experience’ of collaboration was regarded as ‘not at all important’ to most participants despite almost half of them making use of the tutor forums for assessment purposes.

Although many of the courses were employing assessment tasks that could be considered as ‘authentic’, only 25% of the academics had heard of the terms ‘authentic learning’ and ‘authentic assessment’, which is a low response compared with ‘learning design’. However, there has been a well-publicised learning design initiative taking place across the university. This finding suggests that authentic assessment needs to be given priority in future assessment projects at the Open University. Particular emphasis needs to be placed on meaningful assessment especially since student negotiation around assessment was not considered important across the different subject domains but has been shown to impact on how meaningful students find their assessments. More negotiation can be seen to take place with open-book, open-web examinations. Williams and Wong (2009) used this approach when assessing final year business students as they believed this approach mirrored real life problem solving scenarios. They also found that authenticity ‘engages students and inculcates deeper and enriched learning’.

Although Cummings and Maxwell (1999) argued that authenticity is the way to go, they found that a lack of understanding of what makes an assessment really authentic resulted in a shortfall in assessment practice. This questionnaire has revealed academics’ lack of comprehension and points the way towards increasing understanding in order to avoid making assessment appear on the surface to be more like real-life but with the students perceiving them as more artificial and contrived. Looking towards frameworks for designing authentic assessment and drawing upon Gulikers et al.’s (2008) five dimensions of authenticity will prompt future work in this demanding arena in order to promote the ‘assessment for learning’ agenda throughout the University.
