Tutor perspectives on the use of visuals in undergraduate assignments

Maria Leedham
maria.leedham@open.ac.uk

BAAL 2013
Aim

• Investigate the writing of L1 Chinese and L1 English students in three disciplines (Biological Sciences, Economics and Engineering).

Outline

1. Establish that there are differences in use of visuals
2. Investigate tutors’ views on this
3. Explore EAP tutors’ views
Background: Framing in academic literacies

Deficit approach

• student writing is ‘remedial’, ‘immature’ and contains ‘problems’ or ‘errors’ - especially L2 English student writing (Chen and Baker, 2010; Paquot, 2010)

  Vs.

Academic literacies approach

• writing within the academy is a set of social practices in which genre, context and culture are highly significant

• highlights ‘the variety and specificity of institutional practices, and students’ struggles to make sense of these’ (Lea and Street, 2006: 376).

• All student writers are in a constant struggle to establish the preferred ways of making meaning within their particular context (e.g. Lillis, 2006).
The data

The corpora

- British Academic Written English (BAWE) & beyond
- All proficient writing
- 58 texts from L1 Chinese students (107,000 words)
- 202 texts from L1 English students (429,000 words)

Interviews & questionnaires

- Interviews with 18 lecturers in Biological Sciences, Economics and Engineering in 6 UK universities
- Questionnaire responses from 200+ teachers of EAP (English for Academic Purposes)

ESRC project number
RES-000-23-0800

- Interviews with students - ongoing
The role of maternal effect genes in the development of the nematode Caenorhabditis elegans

ABSTRACT

Caenorhabditis elegans (C. elegans) has been used as one of the favourite model organisms for developmental studies. Embryogenesis of C. elegans extensively relies on maternal effect genes for intrinsically asymmetric cell division and cell-cell interactions. In this review, the early embryogenesis of C. elegans, from the establishment of Anterior-Posterior polarity initiated by sperm entry to the asymmetrical cell divisions and different cell lineages induced by a variety of cell fate determinants is summarized, some of the molecular mechanisms carried out by the crucial maternal expressed cell fate determinants underling these processes are described.

INTRODUCTION

The C. elegans and its life cycle

Caenorhabditis elegans (C. elegans) is a small (~1 mm long) free living soil nematode that has a predominantly hermaphroditic adult life. (Figure 1)

Figure 1 Adult C. elegans [1] Upper diagram: differential interference contrast image of an adult C. elegans. Lower diagram: anatomical structures of adult C. elegans (schematic drawing). Middle Left scale bar: 0.1 mm

The life cycle of C. elegans contains an embryonic stage, four larval stages (L1-L4) and an adult stage. (Figure 2) Molt (apopylsis, new cuticle formation, and ecdysis) takes place at the end of each larval stage. Under certain external conditions such as starvation, a non-growing stage, dauer larvae, may form through a facultative, reversible, arrest at the lethargus in the second of four cuticle molts. The life cycle is about 2 to 3 weeks. Each

approximately 5,000 C. elegans proteins have already been matched to homologous human gene transcripts (Lai et al., 2000). Specific mutants may be produced by targeted deletion through transposon insertion or mutagens. Embryos may be manipulated by transformation or injection with transgenes and marker proteins such as green fluorescent protein (GFP) are easily visualised in the transparent embryos. RNA interference (RNAi) is a particularly useful technique for studying maternal effect genes by eliminating the expression of specific matreal or zygotic genes in offspring.

Introduction

The potential of Caenorhabditis elegans as a model organism for the study of embryology emerged in the 1970s (Brenner, 1974). This free-living soil nematode is ideal for studying in the laboratory as it has a rapid period of embryogenesis (16 hours) and each worm has an invariant cell lineage, with exactly 959 somatic cells in the adult, which can be easily traced during development through the transparent cuticle (Stulst & Horvitz, 1977). C.elegans is a small round-worm, approximately 1 mm long, that lives for 2-3 weeks and can be fed on Escherichia coli, which allows large numbers to be conveniently raised in a Petri dish. The predominant adult form is hermaphroditic, containing both sperm and eggs and therefore reproduction is rapid, either by self-fertilization or by cross-fertilization with the rare males.

The genetics for C.elegans is advancing rapidly; it has a small genome at 6 x 10^7 bp and relatively few genes for a eukaryote — around 17,500. It was the first multicellular organism for which the genome was completely sequenced (C-elegans Sequencing Consortium 1998) and
Bulleted lists vs. connected prose in Economics

2. Bivariate Regression and Multivariate Regression

(a) Bivariate Regression

**ECONOMICS 1 Assignment 1**

- Year 2002 vs. Year 2003 vs. Year 2004: The average marks for 2002, 2003 and 2004 students are 63.66, 61.70 and 69.19 respectively. Students in 2004 did better than Year 2002 and 2003. These qualitative variables would have some impacts on the QTMARK, but whether they are statistically significant will be investigated later.

**Correlation matrices**

- **L1 Chinese writer**
  
  Some fail to find that QTMARK has strong positive relationships with variables ABILITY, ALEVELSA, ATTJ, ATTJ, and strong negative relationships with variables ENGLISH and TOPS. This could be explained that students who get drunk cannot get up early to attend the lectures and classes. The more TOPS they attended, the more money they spent on alcohol.

  **L1 English writer**

  Generally, ENGLISH has strong positive relationships with ALEVELSA and ALEVELS, indicating negative relationships with ABILITY and TOPS. This could be explained that the more TOPS students finished, the fewer hours they spent on reading and the higher ability student has the less hour of study is required for him/her. On the other hand, students having a good A-level record maintained their hard working attitude.

**L1 Chinese writer**

(b) Multivariate Regression

- **LT Chinese writer**
  
  The following results are achieved after running the bivariate regressions in EViews.

  - QTMARK = -0.046 + 0.000344 * ATTJ
  
  **L1 English writer**

  Interpretation for the regression results:

  - The intercept -0.046 means that even students did not attend any revision lecture, they could get 64.97 in the exam, which may not make much economic sense as revision lectures are designed to boost a student’s exam marks.
  
  - Slope coefficient of 0.000344 shows an inverse relationship between the attendance of revision lectures and exam performance. It means that 1% increase in the proportion of revision lectures would decrease students’ exam mark by 0.000344 in the exam. However, this slope coefficient is too small, we can hardly notice its effect.

  - Standard error of about 0.000047 means that only 0.0047% of the variation in QTMARK is explained by ATTJ. Therefore, it could be concluded that ATTJ has such a trivial effect on exam performance that it could even be omitted.

  Two-tailed t-test for the significance of the slope: 0.01

  - H0: β = 0 (Proportion of revision lecture attended does not affect exam performance)
  
  - H1: β ≠ 0 (Proportion of revision lecture attended does affect exam performance)

  Since the calculated t-value is lower than the critical value of 1.99 at 5% significance level, we fail to reject H0 in this case and the conclusion is that revision lecture attendance does not affect exam performance.

**L1 Chinese writer**

(c) Multivariate Regression

- **L1 Chinese writer**

  QTMARK = a + β1ATTJ + β2ABILITY + β3HSQI + u

  Modelling by OLS, we get:

  QTMARK = 56.3257 + 0.160594ATTJ + 0.549506ABILITY + 0.417658HSQI

  Interpretation of the regression results:

  - Refer to “Correlation matrices for these quantitative variables” in the Appendix.

  - Refer to the Appendix for the Regression regression results table.

  - Refer to the Appendix to find out the multivariate regression equation table.

**L1 English writer**

Question 2

- **L1 Chinese writer**

  Interpretation of results (equations 4 and 5 appendix 2): The coefficient on class attendance is 0.13, which implies that holding all other variables constant, if you increase class attendance by 1 unit (1% increase in class attendance in a year), then the exam mark will increase by 0.13 units (0.13% increase in your mark). The coefficient on lecture attendance is 0.05, meaning holding all other variables constant, attending 1% more lectures will increase your mark by 0.05%. The coefficient on revision lecture attendance is slightly surprising, at -0.04, implying that by attending 1% more revision lectures, your mark will decrease by 0.04%. The intercept can be interpreted to mean that if you attended no classes, revision or standard lectures, you would score 56.33.

  **L1 English writer**

  Tests shown in appendix 2: The coefficient on class attendance was significant at the 0.01% level implying that in the multiple regression model, class attendance has a significant impact on test mark. The coefficient on lecture attendance however was not significant, even at the 10% level, implying perhaps that lecture attendance does not have a significant impact in a multivariate framework. However, lecture attendance does appear to have a reasonably high correlation with class attendance, so the regression may be suffering from multicollinearity, which has made the result not significant. However, multicollinearity must be occurring with another factor being ‘helpful’ for it to have a negative impact on the regression. The coefficient on revision lecture attendance was significant up to the 1% level, thus implying that while we can fairly sure that revision lectures have a significantly negative impact, we are unable to scope for the fact that the null hypothesis is indeed correct (type I error) and that the result is not significant.

  The F-test for the joint explanatory power of the independent variables yielded an F-statistic of 13.97. This is significant at the 0.01% level as it exceeds the critical value of 3.78. Hence we can reject the null hypothesis given in the appendix. This means that the explanatory variables have made a significant joint contribution to exam performance.

  **L1 Chinese writer**

  **Question 3**

  To investigate whether there are differences in performance between the sub-sample of 2002 students and previous year’s students, I have created an intercept dummy variable and added them to the original equation, as shown by equations 1 and 2 in appendix 3. The first equation is known as the restricted equation, as opposed to the unrestricted model in equation 2, because it imposes the F-test null hypothesis (see hypothesis 4). Equation 2 in appendix 3. Hence in equation 2, the intercept is allowed to vary whereas it is not allowed to equation 1 and is assumed to be constant in all years.

  Interpretation of F-coefficient

  The intercept in equation 3 can be interpreted as before, meaning that if you attended no lectures and had no A’s or A* level, you would score 56.97. This is slightly nonsensical in the sense that you would not have taken the course if you did not score an A at A level. The coefficient of 0.14 on lecture attendance means that if you attended 1% more lectures you would get 0.14 out of 100 more in the exam cetners permi. The coefficient of 0.04 on ATTJ’s score at A+ level you would get 0.04 more cetners permi. The dummy variables in this case have a slightly different interpretation. Basically they say how much the intercept will move up or down compared to the omitted category, the year 2000 students. The dummy variable coefficient at 1999 of -0.19 means that if you are a 1999 student, you will score a proportion of 1.19% less than if you are 2002 student. The coefficient of -0.03 on the 2000 dummy variable means that means that you will score a proportion of 0.03% less than if you were a 2002 student. Finally the coefficient of -0.03 on the 2001 dummy variable means that you will score a proportion of 0.03% less than if you were a 2002 student. These are shown in equations 3 to 6.

As reported in question 1, the regression coefficient was 0.67.
Methods

1. Extraction of corpus linguistic keywords and counts of visuals

2. Thematic analysis of lecturer interviews

3. Quantitative and qualitative analysis of questionnaire responses
## Keywords relating to visuals and lists

A word which is *positively* key occurs *more* often than would be expected by chance in comparison with the reference corpus.
Keywords relating to visuals and lists

**Biology**
- All "Phases" are labeled on the graph. The curve of the Exponential Phase was straight, though some point lay outside this best straight line of fit (0041a).

**Economics**
- Actually the total loss resulting from the lower monopoly output (Q M) is the grey triangle. The part of the grey triangle above P C is the loss of consumer surplus (6008q).

**Engineering**
- According to the program and refer to the figure 4.1.1, it is easy to find… (6107d).

Lists and ‘listlikes’

- Sales promotion:
  - Monthly promotions, according to customer sales and current interest
  - Discounts for bulk orders
  - Free P&P on orders over £25, encouraging bulk buying
  - Discounts for new businesses using us for the first time, on condition they use us for a minimum of two more orders

- Public relations:
  - User friendly website
  - Easy search tools within website, enabling you to find the exact bulb you want even for the engineering minded
  - Extensive “Help” and “FAQ” pages
  - 12-hour guaranteed reply to email queries

Conclusions

The experiment yielded the following conclusions:

- The efficiency of a single stage centrifugal pump at high pump speed (3000 RPM) is better than it at low pump speed (2000 RPM).
- The input power with high pump speed increases faster than the one with low pump speed as discharge increases.
- The relationship between total head and discharge is not affected by pump speed, but higher pump speed provides higher total head.

Summary

• L1 Chinese students make significantly greater use of visuals and lists than L1 English students
• All BAWE assignments have been judged proficient
• ➞ suggests these are different, yet equally valued, ways of writing

Questions

• Are visuals and lists used as strategies to meet the challenge of producing extended pieces of writing in unfamiliar genres in L2?
• Perhaps some students are more visually-oriented?
• What do discipline tutors think of this greater use of visuals and lists?
• Do EAP tutors teach students how to use visuals and lists as strategies?
Importance of visuals

- Diagrams and formulae are ‘the spine of the essay’ (Economics)
- The ‘challenge’ is ‘to marry the diagrams with the text’ (Economics)
- Including visuals helps students gain better marks as it avoids having to describe and introducing errors (Biology)
- Marks for presentation may include the assessment of diagrams, tables and overall layout (Engineering).

Being concise

- Preference for ‘precision, incision, concision’ (Economics)
- ‘there’s never been a penalty for an essay that’s too short’ (Biology)
- Good writing is ‘clear’, ‘concise’; and dislike ‘verbosity’ (Engineering)
- British ss ‘use too many words’ - ‘don’t use 10 when you can use 5’.
- Proforma may say ‘include a table here’. May be given font sizes, margin size, line spacing, ‘so people can’t cram in words’.
Bulleted lists are ok

• …but the words have to be ‘particularly good’
• ‘easier to mark if bullet points’
• in exams, bullets are ‘ideal’ not paras. ‘no need to dress it up as an essay’. Be straightforward. (Engineering)
• ‘Gives visual emphasis’.
• ‘essay questions allow you to hide the things you don’t know.’ (Economics)

‘Maths-oriented’ and ‘journalistic’ students in Engineering and Economics

• 2 types of student – ‘maths-inclined student who would be happy putting bullet points instead of prose’ and students who are good at writing prose but ‘not as strong mathematically’.
• students see essays as a ‘refuge from problem-solving questions’ (Economics)
Yet...

• ‘graphic literacy’ is seldom taught in writing classes – *why*?

• Most applied linguists are ‘trained in the humanities, where words are central to disciplinary values and argumentation’  
  Johns (1998:183)

• Tutors may ‘find themselves relying on disciplinary norms they are familiar with’  
  (Gardner and Holmes, 2009: 251)

• There’s often a concentration on ‘linear text’ (Johns, 1988: 183) rather than on the interaction of visuals with text.
Survey of writing tutors

- 219 responses
- 87% of respondents teach in universities
- 60% have been teaching for 10 years +
- 50% + have a Masters degree in Applied Linguistics or Education
- 20% teach at foundation level, 36% UG in-sessional, 34% postgraduate
- Teach a mix of L1 English only, L2 English only, and both L1 and L2 English students
### Teaching the use of visuals

#### EAP Tutors’ views

<table>
<thead>

<tbody>
<tr>
<td>a) My students need to use visuals in their discipline(s).</td>
<td>80%</td>
<td>20%</td>
</tr>
<tr>
<td>c) I teach my students how to include visuals within their academic texts.</td>
<td>65%</td>
<td>35%</td>
</tr>
</tbody>
</table>

- ‘The visuals are too complicated and student specific for me to know thoroughly and they know them better.’
- ‘I don’t know much about their individual subjects - just general knowledge or what I pick up from them.’
- ‘On the presessional course in the UK I taught on, lists were certainly discouraged and little explicit attention was paid to integrating visuals into writing.’
- ‘I have students do an ethnography of writing in their field, so that they can answer these questions.’
- ‘We are often quite detached from the disciplines because our students go into so many different spaces after completing foundation’
- ‘Some students are permitted to use these features and some not, so for this reason it is not sensible to teach them.’
Implications for practice: Writing tutors

• remain open-minded as to what might be acceptable;
• include ‘graphic literacy’ in academic writing classes;
• research writing in their discipline (cf. Johns', 1997, plea for students to become researchers of their disciplines' practices);
• search corpora (e.g. BAWE, MICUSP) for particular discipline features;
• collect exemplars of the writing their students are asked to produce;
• move beyond lexicogrammatical considerations such as the acceptability of I or the choice of passive or active voice to considering assignments holistically
  (e.g. Is it ok to use a table to display results or should these be given in prose? Can the conclusion be presented as a bulleted list? If images are given, can a lengthy caption be included?);
