Additional neutron scattering data for low temperature growth and pore collapse of amorphous solid water

This document contains additional graphs that supplement the data presented in Chapter 9. The graphs are grouped into growth, heating and isothermal measurements and are further divided into results from single and averaged scans. In Section 1, the single neutron scattering patterns for the ice growth are presented, along with the quasi-plateaus used to extract Porod constants (and hence specific surface areas) and the pseudopeaks used to extract periodic spacings. In Section 2, the quasi-plateaus used to extract Porod constants and the pseudopeaks used to extract periodic spacings are presented. The neutron scattering patterns appear in Chapter 9. In Section 3, the single neutron scattering patterns for the ice growth are presented, along with the quasi-plateaus used to extract Porod constants (and hence specific surface areas) and the pseudopeaks used to extract periodic spacings. In Section 4, the single neutron scattering patterns for the ice growth are presented, along with the quasi-plateaus used to extract Porod constants, specific surface areas, the pseudopeaks used to extract periodic spacings, periodic spacings, radii of gyration, $s$ parameters and $d$ parameters. In Section 5, the quasi-plateaus used to extract Porod constants and the pseudopeaks used to extract periodic spacings are presented. The neutron scattering patterns appear in Chapter 9.

The $I(Q) \times Q^3$ pseudopeaks are not shown for the growth of the 50 K and 52 K ices as they were not used to extract periodic spacings. The $I(Q) \times Q^{2.5}$ pseudopeaks are
not shown for the growth, heating or isothermal scans of the 17 K ices for the same reason. Elsewhere, both sets of pseudopeaks are shown, with the one used to extract periodic spacings indicated in the caption. For the single isothermal scans, only the pseudopeaks actually used to extract periodic spacings are shown.
1 Ice growth: single scans

1.1 Neutron scattering patterns

Figure 1: Single neutron scattering patterns for deposition of ices at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
1.2 Quasi-plateaus for specific surface area

Figure 2: Quasi-plateaus used to extract Porod constants (shown by dashed lines) and hence specific surface area for deposition of ices at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
1.3 Pseudopeaks for periodic spacings

Figure 3: Pseudopeaks used to extract periodic spacings for deposition of ices at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
2 Ice growth: averaged scans

2.1 Quasi-plateaus for specific surface area

![Graphs showing quasi-plateaus for specific surface area for averaged deposition scans of ices deposited at different temperatures.](image)

Figure 4: Quasi-plateaus used to extract Porod constants (shown by dashed lines) and hence specific surface area for averaged deposition scans of ices deposited at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
2.2 Pseudopeaks for periodic spacings

Figure 5: Pseudopeaks used to extract periodic spacings for averaged deposition scans of ices deposited at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
3 Ice heating: single scans

3.1 Neutron scattering patterns

Figure 6: Single neutron scattering patterns for heating of ices deposited at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
3.2 Quasi-plateaus for specific surface area

Figure 7: Quasi-plateaus used to extract Porod constants (shown by dashed lines) and hence specific surface area for heating of ices deposited at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second).
3.3 Pseudopeaks for periodic spacings

Figure 8: Pseudopeaks for $I(Q) \times Q^{2.5}$ for heating of ices deposited at a. 50 K and b. 52 K. The pseudopeaks shown here were used up to 90 K for the 50 K ice and up to 100 K for the 52 K ice.
Figure 9: Pseudopeaks for $I(Q) \times Q^3$ for heating of ices deposited at a. 50 K, b. 52 K, c. 17 K (first) and d. 17 K (second). The pseudopeaks shown here were used from 90 K for the 50 K ice, from 100 K for the 52 K ice and throughout for the 17 K ices.
4 Ice isothermal: single scans

4.1 Neutron scattering patterns

50 K deposition

Figure 10: Single neutron scattering patterns for isothermal scans at a. 60 K, b. 70 K, c. 80 K and d. 90 K.
Figure 11: Single neutron scattering patterns for isothermal scans at a. 100 K, b. 110 K, c. 120 K and d. 130 K.
Figure 12: Single neutron scattering patterns for isothermal scans at a. 140 K, b. 150 K, c. 160 K and d. 170 K. The last isothermal scan for isothermal at 150 K was corrupted and so the result is not shown.
52 K deposition

Figure 13: Single neutron scattering patterns for isothermal scans at a. 70 K, b. 80 K, c. 90 K and d. 100 K.
Figure 14: Single neutron scattering patterns for isothermal scans at a. 110 K, b. 120 K, c. 130 K and d. 140 K.
Figure 15: Single neutron scattering patterns for isothermal scans at a. 150 K, b. 160 K, c. 170 K and d. 180 K.
$1^{st}$ 17 K deposition

Figure 16: Single neutron scattering patterns for isothermal scans at a. 20 K, b. 30 K, c. 40 K and d. 50 K. There is only 30 minutes of data for 40 K because the beam went off during measurements.
