Presence

Awareness of another person

Social presence
Connectedness

Rettie (2003)
Internet and social media

The UK is now a "smartphone society"

Smartphones have overtaken laptops as the most popular device for getting online. Ofcom research has revealed, with record ownership and use, transforming the way we communicate.

Two thirds of people now own a smartphone, using it for nearly two hours every day to browse the internet, access social media, bank and shop online.

Ofcom’s 2015 Communications Market Report finds that a third (33%) of internet users see their smartphone as the most important device for going online, compared to 30% who are still sticking with their laptop.

Research Project

Aims

- To contribute to the knowledge and understanding of how a local authority could respond to central government policy direction of development and delivery of social care services via an integrated children’s services model.

- To work in conjunction with the local authority to develop a CPD model that begins with qualified social workers and non-registered social care staff and then broadens to the other members of the workforce within the Children’s Integrated Service.

- To develop a CPD model that will enable Southampton City Council to equip their staff to meet their statutory duties and enhance performance through its focus on development, staff support and retention.
The UK social work sector

Digital capabilities of the adult social care workforce

We recently conducted a survey of staff and managers. These are some of the results.

Perception of skills
- Staff have confidence in their own basic online skills with over 90% feeling confident or very confident.
- But 52% of managers feel staff do not have sufficient basic online skills

Managers and most staff see the benefits of digital technology in:
- 45% improving efficiency
- 8% improving the quality of care services
- 8% offering benefits to people they support

Managers and most staff see the benefits of digital technology in:
- 45% improving efficiency
- 8% improving the quality of care services
- 8% offering benefits to people they support

What stops the use of digital technology?
- Managers: Staff access to digital technology, Lack of workforce development in this area
- Staff: Concerns from a small minority that they would spend less time with the people they support

What is digital technology used for?
- 75% use digital technology to record/monitor delivery of care
- 50% use digital technology with people they support

74% of staff have a personal smartphone.
20% of staff use their personal phone for work purposes.

Internet Technology: An Empowering or Alienating Tool for Communication between Foster-Carers and Social Workers?

Jane Dodsworth*, Sue Bailey, Gillian Schofield, Neil Cooper, Piers Flemming, and Julie Young

Jane Dodsworth is a Lecturer in Social Work at the University of East Anglia. She worked previously as the Inter-Agency Development Officer for Norfolk Area Cafer Protection Committee and is a former social worker with experience in residential care and in generic social work. Her current research interests are in child sexual exploitation and women involved in sex work, the analysis of victim care schemes, linked child protection and offending, and the evaluation of the implementation of a web-based service to improve communication with and between foster-care, Jane Bailey is a senior research assistant at the University of East Anglia. Her current research interest is the use of digital technology to support social care practice. Neil Cooper is a social worker with the Norfolk Area Cafer Protection Committee. For the last five years, he has been working on an analysis of victim care schemes for the Local Police Authority in Norwich, and for the University of East Anglia. His research interests are in child protection, case planning, family work and social work education. Paul Flemming is a social psychologist whose research focuses on the role of digital technology and effective working and also in the area of social work and the home environment. He is interested in the impact of technology on the family environment and the role of technology in the foster care setting.

Journey to create CPD Models
Relationship and direct work with the social work practitioner was the most significant, as was communication:

But I have met good social workers who had actually good communication, you know, good, good bonding with the families, who wanted the best outcome possible. You know, the assessment was done absolutely brilliantly, and actually achieved the outcome set out, you know, really well for them, and there are some very, very good ones within the city and it’s nice to hear, it’s nice to know. (Parent/Carer A)

Because the other day I was on hold for 45 minutes trying to get hold of social services. And that’s from a pay as you go mobile. Yeah. I have now recently just got after three years their social worker’s mobile number, after three years of keep asking them. And it’s took three years to get a mobile number so I can get in touch (Parent/Carer E)

Yeah, like with my foster carer if there’s a incident, like if we have an argument or like something ends up happening, like I would expect a phone call from my social worker to asks me if I’m all right. Because obviously she’d hear about it, and like I wouldn’t hear from her. And it’s like well she clearly don’t care cos otherwise she’d be like phoning me to make sure I’m alright. (Young Person C)
Findings: Non-registered social care staff

Me personally, I’ve had my support worker, what, like well how many months. I’ve probably seen her more than I’ve seen my social worker since I’ve had her (Young Person B)

My support worker tells me there and then, and if she doesn’t know she says I’ll get back to you the next day, and she always gets back to me. (Parent/Carer E)

Yeah, like if we’re on Facebook and she sees a status up with one of us that have been hurt or whatever, she would kind of ring us and be like what’s going on type thing. Do you know what I mean? (Young Person C)
Social presence applied

Social Work and Social Presence
in an Online World

WALTER LAMENDOLA
University of Denver, Denver, Colorado

Human presence is a fundamental consideration of social work practices. The argument in this article is not to undermine such notions but to elaborate on them based on research into social presence, a type of presence projected when a person is associating with others. Communication and information technology support applications that develop social presence and enable sociality. Such forms of presence are not confined to face-to-face encounters but are necessarily relational. Underlying such a realization is the conviction that all flows of social presence must and can be connected and directed in the conduct of social work practices.

KEYWORDS community, mobilities, social presence, sociality

INTRODUCTION

In the United States, the traditional view is that social work grew through two European roots in the mid-1800s: the Charity Organization Societies and the settlement movement. Shortly thereafter, by the end of the 19th century, social work classes were being taught at Columbia University in New York City. Ray Lubove (1965) was one of a number of historians who argued that social work developed in the United States as volunteers working in charitable roles became scarce. Lubove believed that the pressures of modernity contributed to the formation of both the occupation and “agencies,” formal organizations who acted as agents for the needy. For him, the origins of social work were moralistic and personal, but its movement forward was

Figure 1: Two Senses of Social Presence
Rettie(2005)
Communication approaches that are personalised and promote dignity
Communication approaches that are personalised and promote dignity

• Daily mobile encounters that are two-way
• Be prepared to employ flexible professional boundaries
• Express warmth, compassion and caring through other mechanisms like emoticons and posting encouraging comments on social media
Shortcomings

- The first such shortcoming is the small scale research study itself which was designed to answer an entirely different question that was concerned with CPD and not a sense of presence.

- A second major shortcoming at this stage is that the notion of presence makes a passing reference to social work practitioner workload and other organisational factors that might inhibit the nature and type of communication methods used.
Of significance is La Mendola’s own closing comments on the notion of presence which is that:

“an expanded notion of presence for the profession means blending face-to-face encounters with those that are not. It means accepting the premise that social presence is embodied but not contained by physicality. It is an appreciation that in all its forms, social presence is the carrier of relationships” (2010 p.117)
