Conway<sup>2</sup>, <sup>1</sup>School of Physical Sciences, The Open University, Milton Keynes, MK7 6AA, UK ([jack.wright@open.ac.uk](mailto:jack.wright@open.ac.uk)), <sup>2</sup>CNRS, Laboratoire de Planétologie et Géodynamique, Université de Nantes, France.

**Introduction:** MESSENGER data are being used to construct ~1:3M scale quadrangle geological maps of Mercury [1–6]. Here, we present our progress mapping the Hokusai (H05) quadrangle (Fig. 1). A more complete update on this work can be found in [4].

**Data and Methods:** Since H05 is a mid-northern latitude quadrangle (0–90° E; 22.5–66° N), its map is in a Lambert Conformable Conic projection. Linework is drawn at the 1:400k scale, using ArcGIS, for publication at the 1:3M scale, per USGS recommendations [7]. Thus, this map will be compatible with the other new quadrangle maps of Mercury [8].

The basemap is constructed from the MESSENGER MDIS basemap tiles, with an average ground resolution of 166 m/pixel. Ancillary mapping data products include global topography [9], mosaics with high- and

low-incidence illumination from both east and west [10], and an enhanced color mosaic [11].

**Future Work:** The smooth plains within H05 are fully mapped. We are now mapping the cratered plains. Some plains are not easily mapped as smooth or intercrater plains, likely requiring a new unit on the map.
