Background

Questionnaire studies have sought to identify the possible determinants of medical students’ and doctors’ attitudes towards older patients by examining relationships with a variety of factors, such as demographic; educational/training; exposure to older people; personality/cognitive; and job/career variables. This review collates and synthesizes these findings.

Methods

Design: Systematic literature review

Review question: Which variables show a relationship with doctors’ and medical students’ self-reported attitudes towards older patients?

Search terms: Boolean search in title or abstract: [physicians, medical students + 26 synonyms] AND [older people +17 synonyms] AND [attitudes + 18 synonyms].

Search strategy: An electronic search of 10 databases was performed (ABI/Inform, ASSIA, British Nursing Index, CINAHL, Informa Health, Medline, PsycINFO, Science Direct, Scopus, and Web of Science) through to 7 February 2017.

Inclusion/exclusion criteria: Studies were included if they: quantitatively measured and reported attitudes toward older patients in medical doctors or medical students; conducted correlational analyses or difference testing of scores on measure of attitudes towards older patients with any other variable; and published in English in a peer-reviewed journal.

Quality assessment and extraction: Quality appraised using the STROBE checklist (von Elm et al., 2007).

Results: Characteristics of studies

Searches identified 2422 articles; 37 studies met the overall eligibility criteria set.

Quality: rated low quality (n=14); medium quality (n=18); high quality (n=5).

Study setting: USA (n=25); UK (n=3); Singapore (n=3); Australia (n=2); Other (n=4).

Results: Relationships identified

With 14 low quality studies removed from the analysis, the figure below shows a selection of variables investigated for their relationship with attitudes.

Conclusions

Across high and medium quality studies, positive attitudes towards older patients were related to:

• high quality personal relationships with older people,
• interest in pursuing geriatrics,
• intrinsic motivation to enter medicine (such as the desire to help others).

Negative attitudes towards older patients were related to:

• extrinsic motivation to enter medicine (such as financial rewards).

Avenues for future research

• Early identification of medical students who may be interested in working with older patients using questionnaire research;
• Explore intrinsic and extrinsic motivation for entering medicine as a factor for specialising in older patient-dominated areas of medicine;
• Explore the nature of the link between good quality personal relationships (as opposed to frequency of contact) with older people and attitudes;
• Consider geriatrics interventions which focus on personal relationships with healthy older people to improve attitudes.
