Abstract

Today’s smart city agendas are the latest iteration of urban sociotechnical innovation. Their aim is to use information and communication technologies (ICT) to improve the economic and environmental performance of cities while hopefully providing a better quality of life for residents. Urban planners have long-standing tradition of aligning technological innovation with the built environment and residents but have been only peripherally engaged in smart cities debates to date. However, this situation is beginning to change as iconic, one-of-a-kind smart projects are giving way to the ‘actually existing smart city’ and ICT interventions are emerging as ubiquitous features of twenty-first century cities. The aim of this thematic issue is to explore the various ways that smart cities are influencing and being influenced by urban planning. The articles provide empirical evidence of how urban planners are engaging with processes of smart urbanisation through projects, practices, and politics. They reveal the profound and lasting influence of digitalisation on urban planning and the multiple opportunities for urban planners to serve as champions and drivers of the smart city.

Keywords

Digitalisation; innovation; planners; smart cities; urban planning

Urban planning practices have always been closely intertwined with technological development. From the rise of nineteenth century infrastructure networks to the introduction of automobiles, streetlights, spatial analysis tools, personal computers, and the World Wide Web, planners have been tasked with mediating and aligning society and technology to produce contemporary cities (Coutard & Rutherford, 2015; Graham, 2001; Graham & Marvin, 1999; Kurath et al., 2018; Rutherford, 2020). Today’s smart city agendas embody the latest iteration of sociotechnical innovation with the promise of using information and communication technologies (ICT) to improve the economic and environmental performance of cities while hopefully providing a better quality of life for residents.

The rise of smart cities has catalysed numerous debates around the heightened role of technology firms in the management of collective urban services (Coletta et al., 2019; Karvonen et al., 2019), the importance of global competition in attracting businesses and residents (Hollands, 2015; Söderström et al., 2014), and the dangers of privatising infrastructure networks (Marvin et al., 2015; Viitanen & Kingston, 2014). At the same time, the influence of urban planners has been surprisingly muted, despite the fact that smart city agendas are ‘challenging longstanding principles and practices of planning’ (Späth & Knieling, 2020, p. 3). Indeed, the smart city competes with (and sometimes overshadows) sustainable urban development agendas (Evans et al., 2019; Haarstad, 2017; Parks & Rohracher, 2019; Yigitcanlar et al., 2019) and tends to promote universal standards that reinforce a ‘reductionist mode of urban planning and development’ (Joss et al., 2017, p. 31). Cowley and Caprotti (2019) go so far as to characterise the smart city as a form of ‘anti-planning’ that is rapidly replacing the normative foundations of the profession with

Urban Planning, Year, Volume X, Issue X, Pages X–X
notions of efficiency, standardisation, and corporate control. These critiques raise significant questions about the how planners and incumbent planning practices are currently contributing to smart cities and more importantly, how they should contribute in the coming years. In short, what is the role of urban planning in the twenty-first century smart city?

The aim of this thematic issue is to explore the various ways that smart cities are influencing and being influenced by urban planning agendas and actions. The contributors draw on theories and perspectives from urban planning, human geography, science & technology studies, political science, public policy, and sustainability science to interrogate the social and material aspects of contemporary smart city activities. The emphasis on urban planning situates smart urbanisation and the enthusiasm for digitalisation in the longer, multi-faceted trajectory of urban change. Specifically, the authors explore how smart urbanisation is simultaneously ignoring, superseding, and reshaping urban planning practices while also highlighting the ways that urban planners are intervening in these activities.

The first two articles in the collection emphasise the political aspects of smart cities and urban planning through case studies of the globally renowned and highly controversial Quayside development in Toronto. Constance Carr and Markus Hesse adopt a post-political perspective to interpret the actions by Sidewalk Labs (a subsidiary of Alphabet and sister company to Google) in subverting and dominating land use development practices to prioritise private interests over the public good. They emphasise the potential negative impacts of the project on public services of transportation and housing as well as the labour market and illustrate the multiple ways that public authorities are increasingly vulnerable to corporate influence. Kevin Morgan and Brian Webb compare and contrast the technocratic and citizen-centric narratives that have emerged around the Quayside development and note a distinct lack of engagement by urban planners in mediating these frequently opposing agendas. However, recent citizen-led protests have forced the public authority to rethink its role and this has the potential to steer the development in new directions. Both articles highlight the intense conflicts that arise when sociotechnical innovation is fused with future urban land use planning.

A common characteristic of many smart cities programmes and projects is the reliance on experimentation to test new technologies in situ (Cook et al., 2018; Evans et al., 2016; Karvonen, 2018). Lina Berglund-Snodgrass and Dalia Mukhtar-Landgren draw on neo-institutional theory to interpret the actions by Sidewalk Labs (a subsidiary of Alphabet and sister company to Google) in subverting and dominating land use development practices to prioritise private interests over the public good. They emphasise the potential negative impacts of the project on public services of transportation and housing as well as the labour market and illustrate the multiple ways that public authorities are increasingly vulnerable to corporate influence. Kevin Morgan and Brian Webb compare and contrast the technocratic and citizen-centric narratives that have emerged around the Quayside development and note a distinct lack of engagement by urban planners in mediating these frequently opposing agendas. However, recent citizen-led protests have forced the public authority to rethink its role and this has the potential to steer the development in new directions. Both articles highlight the intense conflicts that arise when sociotechnical innovation is fused with future urban land use planning.

The final two articles of the thematic issue focus on the influence of digitalisation on urban planning. Ashlin Lee, Adrian Mackenzie, Gavin Smith, and Paul Box summarise the rise of platform urbanism to illustrate how the digitalisation of collective urban services creates new modes of governance. Their survey of urban data projects around the world reveals the dominance of corporate actors and the promotion of standardised digital practices that lock customers into specific modes of service provision while locking out competitors and alternative approaches. At the same time, they identify multiple examples of how public authorities can design and manage platform services to support community and social groups rather than corporate shareholders. Zipan Cai, Vladimir Cvetkovic, and Jessica Page examine digitalisation from a different perspective by focusing on land use development dynamics in the contemporary city. The authors use a ‘fuzzy’ statistical approach to develop quantitative indicators that reveal the influence of digitalisation on the broader industrial, economic, and social sectors. Their findings suggest the need to focus not only on discrete smart districts and programmes, but also on the more pervasive influence of digitalisation on all facets of urban life.

As a whole, the articles illustrate how the projects, practices, and politics of smart urbanisation are influencing and being influenced by urban planning activities and actions. Planning smart cities involves the development and application of digital tools and systems that can celebrate the diverse, distinctive, and inherently messy character of specific locales rather than support the drive towards more sanitised, generic, and one-dimensional global cities (Aurigi & Odendaal, 2020; Kaika, 2017). Moreover, smart cities are deeply influenced by ‘glocal’ practices of knowledge politics and urban planners need to engage with and influence those global knowledge networks that are shaping local urban development (Davidson et al., 2019; Wathne & Haarstad, 2020). Finally, there is a need to recognise smart cities not as a technological agenda but rather as a sociotechnical agenda that involves fundamental social, political, and
cultural changes (Evans et al., 2019; Glasmeier & Christopherson, 2015; Karvonen et al., 2019). Planners are ideally positioned to identify and shape the relations between technological innovation and society in smart cities by forwarding collective interests and serving as guardians of the public good.

Today’s smart technologies provide urban residents with the ability to generate and share data to inform existing decision-making processes and to hopefully make cities more sustainable, resilient, and liveable. In the not-so-distant future, more sophisticated applications of machine learning and artificial intelligence will have profound and far-reaching influence on urban metabolisms and human life. It is tempting for one to be pessimistic about the rise of the smart city and the increasing influence of big technology corporations on the intimate lives of urban residents. However, the evidence presented in this thematic issue suggests that who and what controls the smart city is still up for debate. Ultimately, this serves as a clarion call for urban planners to fully engage the smart city, serving not only as partners and collaborators in public-private, triple and quadruple helix partnerships, but also as champions for directing technological innovation towards the improvement of urban governance and collective services while always serving the public at large. Planners and planning practices have been bypassed by the smart city agenda for too long; it is time for this to change.

Conflict of Interests

The authors declare no conflict of interests.
