ABSTRACT
The increasingly-adopted mobile devices create new opportunities for the police to engage with citizens at anywhere and anytime. However, there has been limited academic work evaluating these technologies. This paper reports an auto-ethnographic evaluation study of Android community policing (CP) applications (Apps) used in Asia. Without guidance, our study indicates that finding appropriate Asian CP Apps is challenging. This paper reports the descriptive App store characteristics, functionalities, communication channels, and privacy of CP Apps. We conclude with design implications and call for developing the standardized App store description system and a CP App evaluation model.

Author Keywords
Community policing; mobile app; HCID; police; crime.

CSS Concepts
• Human-centered computing~Human computer interaction (HCI)–HCI design and evaluation methods  
• Heuristics evaluation

INTRODUCTION
Community Policing (CP) is initiated to improve the relationships between the police and citizens by involving people in policing [10]. Although the concept of CP is widely adopted and explored, it is difficult to make a transition from traditional policing to community policing [12]. Moreover, due to varied levels of implementation strategies, there are many debates on the effectiveness of community policing in practice [6,9], especially in developing countries. The imputes of Information communication technologies (ICTs) provides great opportunities for enhancing e-policing and digital civic engagement [13]. Most HCI work has focused on online community usage behavior [5], social media e-policing systems [8], and designing new technologies facilitating community engagement in policing [3,11]. However, there is a lack of reported evaluations of the CP technology in scholarly research. Furthermore, we did not find any evaluation standard of CP mobile Apps in the marketplace.

Our work addresses this gap by exploring the community policing techniques underpinning Asian Android CP applications. We focused particularly on Android operating system because 85.9% of mobile device market share in Asia is Android. We asked three research questions: 1) what Apps are available for Asian citizens to engage with the police in the digital way? 2) what are the key functionalities available in Android App marketplace? 3) do these Apps support user’s privacy? We proposed design implications and call for developing the App store description standard and CP App evaluation model. Our work aims to encourage more nuanced discourse of CP technology and their evaluations.

METHODS
The Apps were identified by performing searches of the combination of keywords (community, neighborhood, smart, community-driven) + policing + (engagement, collaboration, communication) via a standalone scraping tool Parsehub on the UK Google Play store, between 1st July to 4th July 2019 (inclusive). Each App’s marketplace information was downloaded automatically, including name, developer, category, rating, number of reviewers, price, and latest update date. This resulted in 3078 Apps after removing duplicates from a total of 16235 Apps.

App Selection
3078 Apps were reduced to 1207 Apps after excluding games and training apps. Then first two authors categorized 1207 Apps as either “not relevant” or “relevant” based on the App title, description, and screenshots available in the App store. The “relevant” Asian Apps were included in the final analysis if they met three criteria: 1) the Asian countries’ names appear in App’s title, or developer, or App description; 2) the App supports the interaction between the police and citizens; 3) the App has an English-language interface. After independent screening for relevance, two reviewers resolved the disagreements by consensus.

These criteria led to 32 Apps from which we further excluded two Apps due to geographic access restriction and two Apps failed to be installed. The remaining 28 Apps were organized based on the citizen-police communication channel and App’s ownership, e.g., 2-way communication police App, 1-way communication third-party App, etc. The coding scheme was interactively revised until agreement among all authors was reached.

RESULTS
Findings are organized into two parts. First, we outline an overview focusing on finding descriptive App characteristics and functionalities; the second part reports more depth into the communication channel and user privacy.

Overviews
Findings indicate that there is a lack of community policing Apps in Asia compared with the western country (mainly the US and Canada). Of 1207 Apps, only 4.06% of Apps were designed for Asian countries (see Figure 1). Without guidance, finding an appropriate Asian CP App on the global market may be challenging.

App Developers and Affiliations
There were 28 App developers in this study, 71.4% of which (20/28) were either police (53.6%, 15/28) or government institutions (17.9%, 5/28). However, only 11 Apps (41.4%, 11/28) provided government’s official contact email address (e.g., @xx.gov.xx) in the marketplace. A total of 8 App developers (28.6%, 8/28) indicated that they were a commercial developer, 2 of which developed CP Apps by collaborating with the police.

Categorization
The 28 Apps reviewed in this study were categorized into 9 categories used to describe Apps on Google Play store. The most popular category is Social (25%, 7/28), followed by Communication (21.4%, 6/28), Productivity (17.9%, 5/28), Tools (14.3%, 4/28), News & Magazine (7.1%, 2/28), Auto & Vehicle (3.6%, 1/28), Business (3.6%, 1/28), Lifestyle (3.6%, 1/28), and Travel & Local (3.6%, 1/28).

App Ratings
Of the 27 rated Apps, there was an average of 2721 raters per App. The average rating was 4.21 stars (out of five stars).

Targeted Audience
Over 92% of the Apps were listed as suitable for everyone in the marketplace (PEGI 3). Parental guidance was recommended by 7.1% of the Apps (2/28). However, we did not find any customized design for children users.

Costs
All of 28 Apps were free to use. Only one third-party App embedded Google Ads.

Police Involvement
Based on the App description and developer information, 82.1% of the CP Apps (23/28) were developed by or in collaboration with the police, 87% of these police Apps (20/23) use police force’s badge as App icon or on the user interface. One-fourth Apps indicated they were the “official” App of the police in the App store description. One commercial App from Pakistan mentioned in the App store description that citizen’s reporting would be sent to the desired department, and one commercial App from Nepal even claimed that police could be reached in the emergency case. These strategies increase the credibility and reliability of the App to potential users. However, we could not evaluate the content source at this stage.

Functionality
An important finding is the prevalence of CP Apps supporting civic engagement, which focused on providing the portal of civil services, such as checking the status of passport, visa, and driving license (see Figure 2).

Six-sevenths (24/28) of the Apps had their main purpose in providing information about traffic (17.9%, 5/28) or policing information, or local community (7.1%, 2/28).

The other main functionality categories were crime reporting (28.6%, 8/28), making complaining (17.9%, 5/28), and emergency communications with pre-defined contacts (10.7%, 3/28) or law enforcement (7.1%, 2/28).

Citizen-Police Communication Channel
The App that supports 2-way communication would have features for synchronous or asynchronous information flow between citizens and the police. A typical instance of this is a chat feature that allowed citizens to discuss a crime report with the (digital) police (see Figure 3, left). Another example of 2-way communication Apps contains both information gathering and information providing features, e.g., UPCOP App from Uttar Pradesh Police in India (Figure 3, right).
The 1-way information flow includes features that allowed police forces to broadcast information to the public (e.g., crime maps, the ‘wanted’ listings, news feeds); or provided citizens to report crime or complaint but without any feedback capabilities (see Figure 4).

Figure 4. Screenshot of ROP-Royal Oman Police App (Left, from Oman) and Report 2 RAB (Right, from Bangladesh).

62.4% of the Apps (18/28) included 2-way communication, of which we only identified two third-party Apps. In contrast, 21.4% of the Apps (6/28) only provided information to the public, while 14.3% of the Apps (4/28) allowed citizens to only report information.

User Privacy
The privacy was evaluated based on the availability of the privacy policy, account registration, and anonymous reporting features of the App.

Privacy Policy
We only found the privacy policy or the terms & conditions from 28.6% of the Apps (8/28).

Account Registration
39.3% of the Apps (11/28) required registration at the first step when using the App. And 21.4% of the Apps (6/28) can be accessed without any registration, of which only one App (commercial developer) allowed users to report suspicious activity without an account. 28.6% of Apps (8/28) provided information access without logging in except for reporting things. Some Apps required the local mobile number or citizen ID for registration.

Anonymous Reporting
Only two Apps in the sample (7.1%, 2/28) allowed users to report crime anonymously.

DESIGN IMPLICATIONS
As App phenomenon continues to grow, users’ ability to find a reliable and credible CP App may become increasingly difficult. We discuss the opportunity for HCI designers to help users select the appropriate tool to engage with the police, particularly among those commercial Apps.

Standardized App Store Description
With 3087 unique Apps identified in the initial sample, users may not have time to view and verify all the details on the App marketplace. Inspired by Shen et al.’s work [14] on evaluating the depression App marketplace, it is worthy to develop a framework to guide App publishers to represent their CP Apps appropriately to potential users seeking mobile applications in policing. For example, including the content source, official contact information, and affiliations could provide useful contexts to assess the reliability and credibility of the App. Moreover, Apps should make a clear differentiation about potential users, as practitioners or citizens.

Safeguarding Users’ Privacy and Safety
The community policing Apps translate traditional functions of the police authorities into digital services yet overlooking the importance of privacy and safety. Moreover, the functions of existing CP Apps are rudimentary with minimal design. This outcome is not surprising, indicating a less explored design space in the policing world. We encourage HCI researchers to explore safeguarding strategies for protecting privacy and safety, especially for vulnerable users. In addition, there are new opportunities for HCI designers to mitigate the harm of exposure to negative content [4,15] and the “Copy Cat” action [2].

Designing Guidelines to Evaluate CP Effectiveness
Similar to APA’s App Evaluation Model [1] for guiding the personal choice of mental health Apps, we argue for the importance of developing a framework for evaluating the effectiveness of community policing Apps, so that citizens can make informed choices based on evaluation outcomes.
LIMITATIONS
This study represents a snapshot of CP Apps found in the UK Google Play store in July of 2019. This work may have limitations in three ways. First, the mobile App market (both App lists and App store description) will have changed at the time of submission of this paper. For example, Google applied the new Google Play rating algorithm in August 2019 [7]. Second, the findings may not be representative of all CP Apps available on the local market or other market places as certain Apps may be localized or licensed only to specific countries. Third, the compulsory registration with citizen ID and local mobile number, and ethical consideration (e.g., cannot submit fake crime report) limited the installation and trial of these Apps.

CONCLUSION
This paper reports the reviews of current Android Apps for community policing available for Asian countries. Findings describe the descriptive App store characteristics, functionalities, communication channels, and privacy of 28 Apps. We conclude with design implications and call for developing the standardized App store description system and a CP App evaluation model.
