AN EXPLORATION INTO THE DEVELOPMENT OF RESILIENCE IN STUDENT MIDWIVES

A longitudinal case study approach in one Higher Education Institution (HEI) in England during the first 18 months of their programme (November 2015–March 2017) involving one cohort of midwifery undergraduate students.

Key Findings

逃生力的发展

 Pairwise comparisons revealed that there were significant differences in True Resilience Scale© scores between the first and the second completion (p= 0.034) and time 1 and time 3 (p= 0.002); there were no significant differences between time 2 and time 3 (p=1.0).

逃生力的开发

In this cohort of student midwives the scale showed that the majority had developed their resilience during the study.

The participants described themselves as developing resilience despite the programme being very hard. They believed that being passionate about midwifery, being adaptable and learning from reflection was key to being resilient as a student midwife. The importance of support and belonging in clinical practice and their mentors were key to success.

Despite the challenges they encountered on the programme, they felt supported and prepared to become midwives.

Aims of study

- To explore what the concept of resilience meant to student midwives.
- To ascertain the role that resilience might play for student midwives and whether it developed or not during the first 18 months of their midwifery programme.
- To explore what the concept of resilience meant to student midwives.
- To ascertain the role that resilience might play for student midwives and whether it developed or not during the first 18 months of their midwifery programme.

Reactability

Passion for midwifery

Reflection & reflexivity

Relationships with significant others

A model of resilience for student midwives

"It’s the positive way in which we can move forward from something possibly that has been a negative experience..." (StMid25/FG4/8 months)

"I think there is a scale of coping. I think the way I understand resilience is an ability to cope and I think it is tested by your circumstances." (StMid 19/int/18 months)

"I think it is being able to bounce back when something does not go as expected..." (StMid17/FG3/18 months)

Conclusions

- The current resilience discourse should be challenged.
- Resilience is an ‘umbrella’ term.
- Resilience cannot be taught but can be promoted.
- A model, which defines resilience for student midwives, is presented for consideration in midwifery curricula to strengthen how reflection and reflexivity is taught and supported. It is based on Fredrickson’s ‘broaden & build’ theory and Tinto’s integration model (adapted for student midwives).

Research design & timescales

- Four focus groups were conducted twice (18 participants) and six participants were involved in one-to-one interviews, to explore issues raised in the focus group. Thematically analysed using Braun and Clarke (2013) stages.
- Biographical information and assessment scores (first 18 months of programme).

The integrated, resilient student midwife
