8 **Abstract**  
9

10  
11 In this essay, we focus on methodological issues that reviewers and editors commonly encounter  
12  
13 when evaluating empirical articles in scholarship of teaching and learning in management  
14  
15 education. We organize our discussion around three stages – design, analysis, and reporting. The  
16  
17 essay identifies which types of issues are likely to receive rejection, and which issues can be  
18  
19 addressed in the subsequent reviews of the manuscript. We provide authors with some  
20  
21 suggestions on how to address these issues in their research.  
22  
23  
24  
25  
26  
27  
28

1  
2  
3 The standards for publishing academic research are higher than ever before, with more  
4 researchers vying to publish their work in journals with limited space (Ashkanasy, 2010).  
5  
6 Conducting academic research is time consuming, resource intensive, intellectually taxing, and  
7  
8 requires immense commitment to withstand the uncertainties of this laborious process.  
9  
10  
11 Scholarship of Teaching and Learning (Stoll) is no different when it comes to the drudgeries and  
12  
13 perils of publishing research. With a sophisticated audience of management educators, authors  
14  
15 are likely to encounter reviewers from the same pool of scholars who review mainstream  
16  
17 management research. Management education research draws upon many domains, but most  
18  
19 notably education research, human development, and management in organizations (Anderson et  
20  
21 al., 2021). Given this broad knowledge base, authors are expected to clearly align the  
22  
23 methodology with the ontology and epistemology of their question of interest.  
24  
25  
26

27  
28 This essay is an effort to help authors publish management education research that relies  
29  
30 on quantitative methods. Journal of Management Education (JME) publishes various genres of  
31  
32 articles, including theory articles, research studies, essays, and instructional innovation; for  
33  
34 details see JME webpage [here](#). In JME articles, quantitative methods are used in empirical  
35  
36 research articles and instructional innovation (INI) pieces. This type of research often examines  
37  
38 the antecedents and outcomes of management education practices at various levels and for  
39  
40 various stakeholders. Some of JME's highly cited articles in this area include, exploring the  
41  
42 antecedents of faculty satisfaction in online education (Stickney et al., 2019), empirical testing of  
43  
44 teaching practices that increases learning impact of student teams (Bacon et al., 1999), and  
45  
46 online and hybrid teaching in management education (Arbaugh & Hwang, 2013). Researchers  
47  
48 also examine how management education intersects, co-creates, or adapts to broader contexts,  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59

2  
3 such as technology (Allen et al., 2021; Ring et al., 2012), climate adaptation, and sustainability  
4  
5 (Maloni et al., 2011; Sroufe, 2020), and social issues (Maloni et al., 2021).  
6  
7

8 JME offers exciting opportunities to test management education theories. In our essay,  
9  
10 we discuss the common issues that our editors and reviewers encounter when evaluating the  
11  
12 Methodological aspects of a quantitative manuscript. While we focus on Methodological issues,  
13  
14 we also want to remind our readers that the conceptual foundations of the manuscript should be  
15  
16 strong. No matter how elegant the quantitative elements are (design and analysis), if the theory is  
17  
18 weak the manuscript is unlikely to receive a favorable review. We discuss quantitative issues of  
19  
20 an otherwise conceptually sound idea. We explain the types of methodological issues that are  
21  
22 more likely to receive a revise and resubmit and those that may lead to outright rejection. We  
23  
24 hope this decreases the mystery of the review process and provides our readers with practical  
25  
26 information to plan their future submissions to JME.  
27  
28  
29  
30

31 We receive a wide variety of empirical and instructional innovation (INI) articles.  
32  
33 Related to INI articles, we receive a high volume of studies where a new experiential or active  
34  
35 learning approach is presented to increase management learning. For INI articles, many journals,  
36  
37 including JME, often require evidence of effectiveness, which can be quantitative (e.g., pre and  
38  
39 post test scores) or qualitative (e.g., analysis of student comments). We also receive empirical  
40  
41 articles that focus on effectiveness of a pedagogical approach, and for these articles the focus is  
42  
43 on testing a theory underlying a teaching approach. As such, empirical studies on learning  
44  
45 approaches require quasi-experimental design, as often random assignments of students are not  
46  
47 possible due to ethical and practical issues (e.g., Reed et al., 2023). Thus, we advise our authors  
48  
49 to brush up their skills in designing and conducting quasi experimental research (Campbell &  
50  
51 Stanley, 2015; Cook, 2015; Cook et al., 2002).  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 We also receive empirical submissions that focus on evaluating various aspects of a  
4 program of instruction, such as student competencies (Halfhill & Nielsen, 2007), based on  
5 existing management and education theories. Furthermore, empirical studies also use  
6 andragogical theories to test predictors (e.g., Westerman et al., 2002) or processes (e.g., Luthans  
7 et al., 2019) of learning outcomes. As such, a wide variety of generalized linear models or  
8 multilevel analytical techniques might be employed depending on the research question.

9  
10 Our editorial board reflected on the most common issues that led to manuscripts being  
11 either rejected or needing significant revisions. We outline these issues in the following three  
12 sections: research design, analytical strategy, and reporting quality. We also provide two tables:  
13 Table 1 summarizes common issues and likely decisions, while Table 2 provides authors helpful  
14 preemptive questions to reflect on at each stage.

### 29 30 31 **A. Research Design**

32 At a broad level, the quality of research design is evaluated by inferring alignment between  
33 the methodological paradigm (deductive or inductive) and the theoretical paradigm (the ontology  
34 and epistemology). In other words, assessment is made to judge whether the testing paradigm fits  
35 the theorized nature of phenomenon (ontology) and how the knowledge of the phenomenon can  
36 be gained (epistemology). Thus, if the ontological positioning is objectivist (e.g., student  
37 learning can be objectively assessed), then the educational theories assume positivist (or post-  
38 positivist) approach (e.g., socio-economic, and dispositional factors that enhance student  
39 learning). This theoretical paradigm requires deductive methodology and quantitative method  
40 and procedures to test the hypothesis (Taylor & Medina, 2011). Here using inductive and  
41 qualitative approaches would often be inadequate. This type of glaring misalignment between  
42  
43  
44  
45  
46  
47  
48  
49  
50

53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 ontology, epistemology, and methodology rarely passes the initial editorial review of the  
4 manuscript and is most likely to be desk rejected. Instead, our essay focuses on nuanced  
5 methodological issues that surface during the detailed blind review of the manuscript. These  
6 issues are related to specific research methods and procedures used to evaluate research  
7 questions that have otherwise well-aligned management education theoretical and  
8 methodological paradigms.  
9  
10  
11  
12  
13  
14  
15  
16

17 Here we address two research design issues in detail. In almost all cases inadequate design is  
18 a serious concern and will warrant a rejection of the manuscript. Thus, we advise authors to  
19 spend considerable time thinking and planning their research design, and pilot testing their  
20 design before venturing into full-fledge data collection. Finding recent published manuscripts  
21 that outline a procedure that evaluates a similar style of research question may help to ensure the  
22 research design is not missing any key elements that will strip away its validity.  
23  
24  
25  
26  
27  
28  
29  
30

31 *1. Serious Design Flaws: Mismatched Design, Convenience Sampling, and Endogeneity*  
32 *Issues*  
33  
34

35 It is expected that theoretical questions raised in the front end of the article are adequately  
36 tested in the empirical section of the article. At a fundamental level, the research design should  
37 be able to test the hypothesized relationships. If a study design is unable to test the research  
38 question presented in the front end of the article, reviewers are left with little choice but to reject  
39 the manuscript. Such issues cannot be addressed without redesigning the study and collecting  
40 more data. For example, suppose authors of an empirical study spent considerable time upfront  
41 arguing how a specific pedagogical approach increases learning outcomes compared with a  
42 traditional instructional method. However, the study design only employed the new method  
43 without testing the traditional method. As we explained earlier, thoroughly reviewing the  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 principles of quasi experimental design methods (Cook et al., 2002) at the onset should enable  
4  
5 researchers to avoid making serious design omissions when testing the efficacy of proposed  
6  
7 instructional methods. Therefore, any claims of one strategy being better than the other would  
8  
9 require a comparison sample to test differences between group outcomes.  
10

11  
12         Such design limitations occur for a variety of reasons, including the use of conveniently  
13  
14 available data that was not collected for conducting research. Researchers who have not  
15  
16 published in management education journals, may wrongly presume that the bar is lower and  
17  
18 make the mistake of submitting a “half-baked” study. As mentioned before, the reviewers are  
19  
20 drawn from the same pool of reviewers who evaluate mainstream management research. The  
21  
22 reviewers and the readers of management education journals are sophisticated researchers and  
23  
24 expect similar high research standards as they encounter elsewhere. Thus, we advise authors to  
25  
26 spend considerable time planning and pilot testing their ideas. For example, at the initial stages  
27  
28 of conceptualization, present your ideas or pilot-study results at brownbag sessions (informal  
29  
30 lunchtime presentations) to clarify research questions and bring rigor in design. If the research  
31  
32 design is weak, there generally is no easy fix, and the manuscript is highly likely to be rejected.  
33  
34 Similarly, researchers need to be wary of endogeneity bias, where the tested effects might be a  
35  
36 result of endogenous (i.e., unmeasured) variables (see Antonakis et al., 2014). Hill et al. (2021)  
37  
38 provide a list of checks and remedies to deal with this bias. In the end, careful design of your  
39  
40 study is the only way to avoid problems that cannot be fixed later.  
41  
42  
43  
44

## 45 46         2. *Inadequate Data: Insufficient Sample, Poor Measurement, and Common Method Bias*

47  
48         The adequacy of sample size is a key issue. It is important to conduct power analysis at the  
49  
50 design stage to recruit an adequate sample size (Kang, 2021). Often our classroom sizes are  
51  
52 limited, which might mean collecting data from multiple classroom sections. This introduces the  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 issue of controlling confounding variables, multiple instructors, content variations, semester-wise  
4  
5 contextual changes, and variations in class timing. Nonetheless, thinking of these issues in  
6  
7 advance and noting implications of unavoidable issues in the limitation section are important  
8  
9 aspects of showing rigor in your work (Patten & Newhart, 2017).  
10

11  
12 Another issue concerns the use of invalid measures. We caution against ad hoc  
13  
14 modification or abbreviation of the validated measurement scales. Whenever possible use the full  
15  
16 validated scale, and if needed, search for and use a validated shortened scale. Always spend time  
17  
18 researching and reviewing the validated scales for the constructs in your research domain.  
19

20  
21 Measurement is a complicated issue and selecting a valid scale is important. We understand,  
22  
23 response burden is a valid concern, and this tempts us to shorten the scales, but ad hoc deletion  
24  
25 or modifications to existing scales will weaken your design. Avoid selecting a poor scale (with  
26  
27 dubious validity) or just making up a scale; It ends up not measuring what needs to be measured  
28  
29 (Bagozzi & Edwards, 1998). Be wary of any modified scale that lacks validity support for the  
30  
31 altered scales, even when this type of work is published elsewhere.  
32  
33

34  
35 Poor measurement is also evident when a hypothesis claims to test broader constructs,  
36  
37 such as student learning or growth, but researchers operationalize variables using measures that  
38  
39 tap into insufficient construct domain. For example, using exam scores to operationalize learning  
40  
41 is problematic. An exam typically tests knowledge, comprehension, and application of concepts  
42  
43 in a subject domain, but they may not include other aspects of learning, such as skill building,  
44  
45 insights, and experiential growth (Kolb & Kolb, 2005). Additionally, researchers sometimes use  
46  
47 incorrect measures, such as measuring student learning using students' ratings of instructors. A  
48  
49 student's rating of instructor does not necessarily reflect student learning.  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 Finally, we emphasize the importance of addressing issues related to common method  
4 variance (Ashkanasy, 2010; Podsakoff et al., 2012; Spector, 2006). This is a bias that usually  
5 occurs when participants are asked to respond to a single-sitting questionnaire that includes  
6 measurement of all variables. While Podsakoff and his colleagues discuss several remedies to  
7 this issue, note that post hoc statistical fixes fail to deal with the main problem, which is  
8 respondents' motivation to respond consistently to items across measures, leading to common  
9 method *bias*. The only way to address this bias is to collect data from multiple sources (e.g.,  
10 supervisor- or peer-reports; or objective measures) or at least to collect data on independent and  
11 dependent measures at different times (Podsakoff et al., 2012).  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23

## 24 **B. Analytical strategies**

### 25 *1. Inappropriate Statistical Approach*

26  
27  
28 When testing hypothesis, it is important to use appropriate analytical approaches. For  
29 example, to show a relationship between instructional approach and student learning outcome,  
30 using zero-order correlations without a concern for control variables affecting the relationship  
31 between these two variables is a mistake. If theoretically relevant control variables were not  
32 collected in a study, then little can be done at the review stage. If such data is present, the  
33 reviewers may ask to rerun analysis, such as adding control variables in the statistical model.  
34  
35  
36  
37  
38  
39  
40  
41  
42

43 Related to the above, a less significant issue can be a misalignment between the way a  
44 hypothesis is worded and how it is assessed. For example, the hypothesis claims that students in  
45 an online environment will improve more over time, compared to the traditional setting.  
46 However, instead of conducting a repeated ANCOVA, the analysis uses cross-sectional  
47 ANCOVA to test group differences between online and traditional settings. The use of cross-  
48 sectional ANCOVA is incorrect because it does not show a change over time (within-subject  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 change). If the sample is adequate, the paper is well-written with sound theoretical arguments,  
4  
5 and all that is needed is to rerun analysis, there is a chance that the reviewers ask for a revision.  
6  
7

8           The incorrect level of analysis is another common issue. Do hypotheses match with  
9  
10 levels of analysis? For example, do you have hypotheses that concern individual student  
11  
12 performance, but measure student team performance? Or do you have variables at various levels  
13  
14 of analysis? For example, a mixture of individual student characteristics and student team  
15  
16 characteristics. In these circumstances you may need to draw on multi-level analysis methods to  
17  
18 avoid drawing erroneous conclusions from your data (see for example, De Leeuw et al., 2008).  
19  
20  
21 Depending on the issues, incorrect level of analysis may lead to either rejection or a high-risk  
22  
23 revision. The manuscript is likely to be rejected if there is a mismatch between the theoretical  
24  
25 level of constructs and the operational level. There is a slight chance the reviewers might  
26  
27 recommend a review if simple analysis needs to be rerun using multilevel techniques.  
28  
29  
30

## 31           2. *Generalizability*

32  
33           JME aims to advance research and teaching pedagogy. As such, generalizability of research  
34  
35 is an important aspect of the review process. We want authors to make sound arguments about  
36  
37 how their research study informs the management education conversations. To achieve this,  
38  
39 authors should be familiar with the broader management education context and provide informed  
40  
41 discussion on classroom and business school implications for an international audience. It is  
42  
43 important to avoid overgeneralization claims and provide a measured discussion by looking at  
44  
45 past research and examining the limitations of your study. For example, a study on the efficacy  
46  
47 of online learning interventions needs to explain how generalizable the proclaimed effects are  
48  
49 and to recognize that there is vast variety in methods of online learning. This discussion must be  
50  
51 evidence based and informed. Please cite evidence from recent studies, show how your study  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 advanced the conversation, and what contexts the evidence does not apply to. Often, if other  
4  
5 aspects of the study are strong and authors did not oversell their results, many of these  
6  
7 weaknesses can be addressed in the review process.  
8

## 9 10 **C. Reporting quality**

### 11 12 *1. Justification of Approach*

13  
14  
15 Justification is a well-supported explanation of why your chosen research design and method  
16  
17 are appropriate for addressing the research question. An assumption should not be made that all  
18  
19 scholars are aware of your quantitative approach. Clearly explaining the strengths of the chosen  
20  
21 design, as well as known limitations, and how they have been mitigated is important. Remember  
22  
23 that core to explaining your research design is communicating the alignment between your  
24  
25 research question and the design approach to collect data for testing the hypotheses. Being able  
26  
27 to clearly articulate why the particular approach was taken will establish credibility and facilitate  
28  
29 the review process. Reviewers often find that researchers need to better justify their data  
30  
31 collection and analysis methods. These issues could lead to reviewers recommending a major  
32  
33 revision of the manuscript.  
34  
35  
36  
37

### 38 39 *2. Completeness and Clarity*

40  
41 A fundamental function of the method section of an article is to provide readers with enough  
42  
43 detail to understand the study and exactly how it was run. Completeness and clarity are equally  
44  
45 important in reporting what you have done, so that reviewers can assess the rigor and validity of  
46  
47 your research. When writing a method section, it is important to remember that the reader knows  
48  
49 nothing about what has happened in the study. Provide a complete explanation of the sample  
50  
51 process, measurement protocols, data collection, and analysis procedures. As with the  
52  
53 justification of approach, the rarer the data collection or analysis technique, the more detail you  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 will need to provide to ensure the reviewers understand precisely how you conducted data  
4 collection and analysis. The flow between information should be logical and all information  
5 should be in the section for a purpose. Detail and clarity are important, so be sure to define any  
6 terms or statistical jargon, work on the clear presentation of results using tables, figures, and  
7 charts, and provide supplementary material with measurement tables and programming code.  
8 Also, be honest. It is better to be upfront with any weaknesses or limitations of the study and  
9 acknowledge openly the impact of them on the results. Being honest and providing detail will  
10 assure the reviewer that you have a true understanding of your study and your method and  
11 results.  
12  
13  
14

15  
16  
17  
18  
19  
20  
21  
22  
23  
24 Be aware of the type of paper when considering the balance of detail in sections. For  
25 empirical articles, it is important to dedicate a significant amount of the submission to detailing  
26 all aspects of the methods and analysis. For INI articles, while details of the methods and  
27 analysis need to be clear, they also need to be concise to focus on providing adequate detail on  
28 the innovation itself. As a reviewer, it can be frustrating to read a method and/or results section  
29 that is incomplete or unclear. In papers where we believe that the underlying research design is  
30 adequate, we will be likely to focus on issues of completeness and clarity as fixable points in a  
31 major revision.  
32  
33  
34  
35  
36  
37  
38  
39  
40

### 41 42 3. *Storytelling*

43  
44  
45 The best academic research is rigorous, engaging, memorable, and accessible. Storytelling  
46 offers a coherent and structured narrative, presenting the significance of methods and results in  
47 relation to the research question. Reflecting on the core ideas, findings, and their implications  
48 within the broader context of scholarly literature and practice aids in crafting a captivating story  
49 that retains the reader's attention. Presenting a clear argument and statement of contribution at  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 the beginning of the paper, giving a comprehensive justification for data collection and analysis  
4  
5 methods, and identifying the crucial themes and patterns in the results to answer the posed  
6  
7 questions, all contribute to a linear structure with a clear beginning, middle, and end. This  
8  
9 structure enhances coherence and helps readers understand the connections between various  
10  
11 elements of the research project. Maintaining a focused, linear "golden thread" throughout the  
12  
13 paper increases the likelihood that readers will grasp complex ideas and find the narrative  
14  
15 compelling. A well-structured paper with a clear story is more likely to receive a revision.  
16  
17

#### 18 19 4. *So what?*

20  
21 “So what?” is a key question that authors need to answer through the reporting of their  
22  
23 methods and results. It is important to reflect on not just what research was completed and  
24  
25 whether the results supported the research questions, but on what the wider relevance of the  
26  
27 study is. A paper must address the primary question driving the JME review process: will this  
28  
29 contribution significantly influence thought and/or practice in management education?  
30  
31

32  
33 Some of the ideas we present in generalizability are connected to the bigger so what question.  
34  
35 This question should be addressed in the front end as the value proposition of your study, and  
36  
37 then bring home the point in the discussion section. At JME, the pedagogical, classroom, and  
38  
39 business education implications are important. Reviewers want to see how your paper fits in the  
40  
41 bigger picture, advances their understanding, and raises important new questions. Although, it is  
42  
43 not strictly a methodological aspect of the study, it provides the reason for accepting the  
44  
45 manuscript.  
46  
47

### 48 49 **Conclusion**

50  
51 Management education research is time-consuming, demanding, but rewarding. We advise  
52  
53 our readers to spend considerable time planning and testing their ideas. To become part of the  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 management education conversation, stay up-to-date on the latest research on instructional  
4  
5 innovation and andragogy. Many journals in our field, including JME, offer free paper  
6  
7 development workshops throughout the year. JME now also offers virtual Editors' Office Hours,  
8  
9 typically from September to April. Notices for these are posted on JME's LinkedIn page (See  
10  
11 Table 2 for a link). The Editors' Office Hours provide researchers an opportunity to seek early  
12  
13 feedback on their research ideas and improve their research outcomes.  
14  
15

16  
17 This essay focused on the methodological aspects of quantitative studies in management  
18  
19 education research. We identified various issues at the three stages of design, analysis, and  
20  
21 reporting. As summarized in Table 1, the issues with the design of the study and problems with  
22  
23 data collection are serious issues that are not fixable at the review stage. We advise authors to  
24  
25 spend considerable time improving study design and avoiding these issues. If the design is  
26  
27 adequate, the issues with the analytical approach might be fixable. At times redoing the analysis  
28  
29 with another statistical approach can remediate analytical issues. Finally, the quality of reporting  
30  
31 can be improved by adequately justifying the study design, method, and analytical approach.  
32  
33 Writing clearly and explaining the rationale and implications for teaching and andragogy are  
34  
35 other vital aspects to help the reader fully appreciate and understand the big picture. We advise  
36  
37 researchers to think of the story they are trying to tell to improve the reporting quality.  
38  
39  
40

41  
42 In Table 2, we have provided authors with some ways to preemptively address the issues  
43  
44 identified in this essay. At each stage, the reflective questions can be used as a checklist to  
45  
46 ensure rigor in research. We also propose several actions that researchers can take to address  
47  
48 potential problems across the three methodological stages discussed in our essay.  
49  
50

51  
52 To sum up, we hope this brief essay provides researchers insights in the review process at  
53  
54 JME and helps them make informed decisions throughout the research process.  
55  
56

	<ul style="list-style-type: none"> <li>Omission of explanatory variables leading to endogeneity bias.</li> </ul>			
<p>2. <i>Inadequate data:</i></p> <p><i>Insufficient sample, poor measurement, and common method bias</i></p>	Small Sample may result in inadequate power to detect small effects.		X	
	Ad hoc modification of valid scales, using scales with limited validity evidence, using narrow measures for a broad construct, or using incorrect measures.	X		
	Common method issues that arise in survey research from collecting independent and dependent variables at the same time.	X		
<b>B. Analytical strategies</b>				

1. <i>Inappropriate statistical approach</i>	Testing relationships with zero-order correlations without controls. Fixable, if control variables were collected.		X	
	Misalignment between hypothesis wording and testing. For example, testing hypothesized within subject effects with between-subject tests.		X	
	In adequate attention to the level of analysis. For example, individual performance should not be confounded with team performance. If you have a multilevel conceptual model, then use multilevel analysis. These types of issues might lead to a rejection or a high-risk revision.	X	X	
2. Generalizability	Making overgeneralization about the relevance of the study results or a failure to			X
